Lazard's Theorem

Theorem (Lazard)

The ring $L \cong \mathbb{Z}[u_1, u_2, ...]$ can be equipped with a universal formal group law $U(x, y) \in L[x, y]$. In other words, if G(x, y) is a formal group law R, then there is a unique map

$$f: L \to R$$

such that

$$f_*U(x,y)=G(x,y).$$

. Institut de Recherche Mathématique Avancée

Justin Noel, Joint w/ Niles Johnson

Quillen's Theorem

Theorem (Quillen)

The universal map from L to π_*MU is an isomorphism.

Quillen's Theorem

Theorem (Quillen)

The universal map from L to π_*MU is an isomorphism.

Corollary

$$\pi_*MU \cong \mathbb{Z}[u_1, u_2, \ldots], \ |u_i| = 2i.$$

Theorem (Adams)

A complex orientation $MU \rightarrow E$ is a map of ring spectra that determines a formal group law in $E^*(BU(1) \times BU(1))$ under the above isomorphism.

Justin Noel, Joint w/ Niles Johnson

Institut de Recherche Mathématique Avancée

p-typical formal group laws

Definition

A formal group law F is p-typical if the p-fold formal sum $[p]_F(z) = z +_F z +_F \cdots +_F z$ can be expressed as

$$[p]_F(z) = \sum_{n\geq 0}^F a_n z^{p^n}.$$

Justin Noel, Joint w/ Niles Johnson

Institut de Recherche Mathématique Avancée

p-typical formal group laws

Alternatively, if F is defined over a torsion free ring this is equivalent to requiring

$$\log_F(x) = \sum_{n \ge 0} b_n x^{p^n}$$

where

$$x +_F y = \log_F^{-1}(\log_F(x) + \log_F(y)).$$

Justin Noel, Joint w/ Niles Johnson

Institut de Recherche Mathématique Avancée

The Brown-Peterson spectrum

Applying a standard construction in the theory of formal group laws, Quillen was able to construct an idempotent map:

Institut de Recherche Mathématique Avancée

Justin Noel, Joint w/ Niles Johnson

The Brown-Peterson spectrum

Applying a standard construction in the theory of formal group laws, Quillen was able to construct an idempotent map:

$$MU_{(p)} \xrightarrow{\varepsilon} MU_{(p)}$$

that classified a universal *p*-typical formal group law.

Institut de Recherche Mathématique Avancée

Justin Noel, Joint w/ Niles Johnson

The Brown-Peterson spectrum

Applying a standard construction in the theory of formal group laws, Quillen was able to construct an idempotent map:

$$MU_{(p)} \xrightarrow{\varepsilon} MU_{(p)}$$

that classified a universal *p*-typical formal group law.

The "image" of this map MU_(p) is the Brown-Peterson ring spectrum BP. It satisfies a p-typical analogue of the universal property for MU.

Justin Noel, Joint w/ Niles Johnson

$\overline{E_{\infty}}$ ring spectra

- the map f makes E_{*} into a Landweber exact theory,
- the above prime p is smaller than 17,
- then π_*E is a \mathbb{Q} -algebra $\implies E$ is a generalized rational Eilenberg-Maclane spectra (*E* is a retract of $H\mathbb{Q} \land E$).

Pattern

We have the following pattern: In the computed range, for $p \ge 5$ up to multiplication by units:

$$MC_{2(p-1)}(\xi) = v_1^{3p+1}\xi^{5p^2-8p+3} + O(\xi^{5p^2-8p+4}).$$
